## Protecting Our Water Sources

 to drink.| Substance | Concentration <br> Range Found | Average Level | Source of Contaminant |
| :--- | :---: | :---: | :--- | :--- |
| Bromoform (ppb) | $0-1.59$ | 0.23 | Byproduct of drinking water disinfection. |
| Bromodichloromethane | $0-1.3$ | 0.19 | Byproduct of drinking water disinfection. |
| Dibromochloromechane (ppb) | $0-2.07$ | 0.4 | Byproduct of drinking water disinfection. |

If you would like to find out when SAWS Board meetings and Town Hall meetings are scheduled, call SAWS Communications and Community Outreach Office at 233-3621. You can

An aquifer is a geologic formation which may contain sand, gravel, clays and/or limestone that collects and holds rainwater as it flows through the ground. This happens over the recharge zone. It is important to protect the recharge zone from contamination such as fertilizer, petrochemical products, and other chemical contaminants because they might eventually filter into the water supply in the aquifer. There are strict regulations about what may and may not be discharged over the recharge zone, and aquifer water is checked and analyzed regularly to be sure it is safe

## SAWS Water: It's the best thing running

San Antonio has seceived the award for "Bet Tasting
Drinking Water in Texas.
At SAWS we have a lot of things to celebrate. Now we have one more: The "Best Tasting Drinking Water in Texas." Thanks to all our efforts at protecting and conserving this great resource, we were awarded this special designation by the Texas Section of the American Water Works Association Water samples were judged on overall taste, odor, color, and clarity. As the undisputed champion, our water will go on to compete nationally. So what does this championship mean? Simply that we all share in the credit for making our water clearly the best.

## Kelly USA

 Water OualityReport 20013

Public water systems, like San Antonio Water System (SAWS), are required by law to report every year on the type and quantity of substances that are in our water. This law - the Safe Drinking Water Act (SDWA) that was amended by Congress in 1996 - has specific guidelines concerning drinking water quality, as well as the methods and frequency of testing. The data in this Water Quality Report was recorded within the last five years according to SDWA regulations.
The Environmental Protection Agency (EPA) administers the SDWA to make sure tap water is safe to drink by restricting the presence of contaminants in public water systems. Locally this is carried out by the Texas Commission on Environmental Quality (TCEQ).
SAWS conducts daily testing on the quality of water. In addition, TCEQ also reviews the Edwards and the Trinity aquifers as part of its source water assessment.

## Our Commitment to You

SAWS has a long-term commitment to providing our customers with excellent drinking water. Historically, SAWS and its predecessors have been rated as a superior water system since 1936.
Your confidence in San Antonio's water supply is important to us at SAWS. We are committed to providing reliable, quality water.

Where Kelly USA Water Comes From
During 2005 - the testing period represented in this report SAWS drinking water for Kelly USA was derived as ground water from the Edwards Aquifer.

## What are Contaminants?

The technical term for anything other than water is "contaminant." It is natural for drinking water to contain

contaminants, but as you will see, San Antonio's water i well within allowable limits. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk.
Sources for drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substance resulting from the presence of animals or from human activ ity.

What are Secondary Constituents?
Many constituents (such as calcium, sodium, or iron) which are often found in drinking water, can cause taste, color, and odor problems. The taste and odor constituents are called seondary constituents and are regulated by the State of Texas, not the EPA. These constituents are not causes for health concern. While secondary constituents are not required to be reported, a table with this information is on page 3 of this report.

## Special Notice

For Elderly, Infants, Cancer Patients People with HIVIAIDS or Immune Problems: drinking water than the general population. Immunocompromised persons such as person with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The EPA/Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791),

## Your Water Quality Report

TCEQ has completed an assessment of our source water and results indicate that some of our sources are susceptible to certain contaminants. The sampling requirements for our water system are based on this susceptibilty and previous sample data. Any detections of these contaminants will be found in this repor
Contaminants that may be present in source water include:

- Microbiological contaminants, such as viruses and bacteria which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife. Cryptosporidium is an example of a microbiological contaminant affecting surface water sources. Since
SAWS

ridium was not a tested contaminant.

## Understanding The Charts

Maximum Contaminant Level Goal (MCLG): The level of a contami-
Maximum Contaminant Level Goal (MCLG): The level of a contamihealth. MCLGs allow for margin of safety
Maximum Contaminant Level (MCL): The highest level of a contam hant that is allowed in drinking water. MCLs are set as close to the MCLG as feasible using the best available treatment technology.
Maximum Residual Disinfectant Level (MRDL): The highest level of disinfectant allowed in drinking water. There is convincing evidence that ad dition of a disinfectant is necessary for control of microbial contaminants. Maximum Residual Disinfectant Level Goal (MRDLG): The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
Action Level: The concentration of a contaminant which, if exceeded, trig gers treatment or other requirements which a water system must follow.

Inorganic contaminants, such as salts and metals which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming;

- Pesticides and herbicides, which may have a variety of sources such as agriculture, urban storm water runoff and residential uses;
- Organic chemical contaminants which are by-products of indus trial processes and petroleum production and can also come from ga tations, urban stormwater runoff and septic systems; and
- Radioactive contaminants, which can be naturally occurring or the result of oil and gas production and mining activities.
For more information on source water assessments and protection efforts at our system, please contact us at 210-704-SAWS (704-7297).

Secondary Constituents (2002-2005)

| Constituent | Concentration Range | Average Concentration Found | Limit (ppm) |
| :---: | :---: | :---: | :---: |
| Bicarbonate (ppm) | 196-203 | 199 | Not Regulated |
| Calcium (ppm) | 66.1-67.8 | 67.4 | Not Regulated |
| Chloride (ppm) | 18-32 | 22 | 300 |
| Copper (ppm) | 0.015-0.024 | 0.017 | Not Regulated |
| Magnesium (ppm) | 15.1-16.6 | 16.2 | Not Regulated |
| pH | 8-8 | 8 | 7 |
| Sodium (ppm) | $10-19$ | 16 | Not Regulated |
| Sulfate (ppm) | 14-29 | 18 | 300 |
| Total Hardness as Calcium/Magnesium | 227-236 | 230 | Not Regulated |
| Total Alkalinity as Calcium Carbonate | 196-203 | 199 | Not Regulated |
| Total Dissolved Solids | 269-293 | 287 | 1,000 |
| Zinc | 22.3-51.2 | 29.5 | 5 |

Not regulated: The contaminant is not currently regulated by the Envi ronmental Protection Agency
$\mathrm{pCi} /$ : Picocuries per liter. A measure of radioactivity in water.
ppm: Parts per million. One part per million equals one teaspoon in 1,302 gallons, which is enough water to fill a typical bathtub more than 40 times.
ppb: Parts per billion. One part per billion is equal to one teaspoon in 1,302,000 gallons - enough to fill a typical bathtub more than 40,000 times.
N/A: Not applicable
ND: Not detected
Points-of-entry: Entry poin to the distribution system which is represen tative of each well after disinfection.
Remember that these substances are shown in parts per million or parts per billion. As you will see in these charts, water delivered by SAWS is of excellent quality

## Inorganic Contaminants (2002-2005)

| Substance | Concentration <br> Range Found | Avg. Conc. Found | MCL | MCLG | Possible Source |
| :--- | :---: | :---: | :---: | :---: | :--- | :--- |
| Barium (ppm) | $0.046-0.060$ | 0.057 | 2 | 2 | Discharge from drilling wastes; discharge from metal <br> refinerisserosion of natural deposits. |
| Chromium (ppb) | $2.8-3.2$ | 3.1 | 100 | 100 | Discharg from steel and pulp mills; rosion of natural <br> deposits |
| Fluoride (ppm) a | $0.31-0.4$ | 0.35 | 4 | 4 | Erosion of natural deposits; Discharge from fertilizer and <br> aluminum factories. |
| Nitrate (ppm) | $1.92-2.02$ | 1.96 | 10 | 10 | Runoff from fertilizer use; leaching from septic tanks, <br> sewage; erosion of natural deposits. |
| Gross alpha (pCi/l) | $0-1.2$ | 0.3 | 15 | 0 | Erosion of natural deposits. |

Fluoride in the form of hydrofluorosilic acid $\left(\mathrm{H}_{2} \mathrm{SiF}_{6}\right)$ was added to SAWS drinking water as of August 2002

## Maximum Residual Disinfectant Level

| Disinfectant | Test <br> Year | Concentration <br> Range Found | Avg. Conc. Found | MRDL | MRDLG | Possible Source |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Chlorine Residual, <br> Free (ppm) | 2005 | $0.21-0.92$ | 0.49 | 4 | 4 | Disinfectant used to control microbes. |

Total coliform bacteria are used as indicators of microbial contamination of drinking water, because testing for them is easy. While not disease-causing organism hemselves, they are often found in association with other microbes that are capable of causing disease. Coliform bacteria are more hardy than many disease-causing organisms; therefore, their absence from water is a good indication that the water is microbiologically safe for human consumption.
Fecal coliform bacteria and in particular, E. coli, are members of the coliform bacteria group originating in the intestinal tract of warm-blooded animals and are passed into the environment through feces. The presence of fecal coliform bacteria (E. coli) in drinking water may indicate recent contamination of the drinking water wit fecal material. The table below indice

Microbiological Contaminants Monitoring (2005)

| Total Coliform Bacteria (presence) | b | Highest monthly number of positive samples: 2 | Naturally present in the environment |  |
| :---: | :---: | :---: | :---: | :---: |
| b Presence of coliform bacteria in $5 \%$ or more of the monthly samples. <br> c A routine sample and a repeat sample are total coliform positive, and one is also fecal coliform or E. coli positive |  |  |  |  |
| Violation (2005) |  |  |  |  |
| Violation Type | Duration | Health Effects | Explanation | Steps to Correct |
| Coliform - Failure to notify consumers of a bacteriological related violation | 9/1/2005 to $9 / 30 / 2005$ | Failure to notify consumers of a becteriologial related violation makes it impossible for consumers to consider alternatives to drinking water that is contaminated or inadequately tested | During this period SAWS was unaware that trigger levels for reporting requirements had been reached. | Requirements were clarified with technical personnel following discussions with TCEQ. |
| Total Coliform Non-acute MCL No Fecal Found | 9/1/2005 to $9 / 30 / 2005$ | Coliforms are bacteria that are naturally present in the environment and ar used as an indicator that other, potentially-harmful, bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems. | A positive sample for total coliform was identified at a single sample location. | Follow-up testing indicated no presence of coliform bacteria |

Lead and Copper Results ${ }^{\text {d (2005) }}$

| Substance | 90th Percentile | Action Level | Number of Sites Exceeding Action Level | Possible Source |
| :---: | :---: | :---: | :---: | :---: |
| Lead (ppb) | 14.5 | 15 | 2 | Corrosion of |
| Copper (ppm) | 0.253 | 1.3 | 0 | household plumbing |

Distribution Sampling for By-Products of Drinking Water Chlorination (Disinfection) (2005)

| Substance | Concentration <br> Range Found | Highest Concentration <br> Found |  | MCL | Source of Contaminant |
| :--- | ---: | :---: | :---: | :---: | :--- |
| Total Trihalomethanes (THMs) $(\mathrm{ppb})$ | $1-5.9$ | 3.9 | 80 | Byproduct of drinking water disinfection. |  |
